US-09-904-568-1 835 1 atgtctgctttgggggctgc......gagtcaacagctgggcaggg 835 Title: Perfect score: Sequence: Scoring table:

1737 seqs, 32719 residues IDENTITY NUC Gapop 10.0 , Gapext 0.5 Searched:

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 8 Maximum DB seq length: 50

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 1786 summaries

rngdb:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present invention relates to nucleic acid sequences encoding human peptide histidine transporter 1 (hPHT1) protein, the hPHT1 proteins and methods for using them. The nucleic acid sequences of the invention are is useful for screening a test compound for human PHT1 modulating activity. The hPHT1 proteins are useful as a target for evaluating activity. The hPHT1 proteins are useful as a target for evaluating peptide based drug transport. The functional characterisation of hPHT1 and the ability to correlate the Michaelis-Menten kinetics for a particular substrate to the molar expression level of hPHT1 provides crucial information regarding the ability of this transporter to facilitate the uptake and transport of peptides and peptide-based drugs. The PHT1 proteins facilited peptide transport across cell membranes in the gastrointestinal tract and other organs in which they are expressed. The identification of full length hPHT1 clone facilitates the development of optimal peptide-based drugs for treating patients with hPHT1-related of diseases. AAS20912-AAS20925 represent PCR primers used in the methods of
                                                                                                                                                                                                                                                                                                Novel isolated human peptide histidine transporter which facilitates peptide transport across cell membranes in gastrointestinal tract, useful as target for evaluating peptide and peptide-based drug transport.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         : anterior pituitary hormone; hypertension; autoimmune disease; failure; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to producing a Sub-population of labeled nucleic source, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of Nas, where each each labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAs which is useful for analysing the differences in the RNA profiles between several different physiological sources, where the method comprises producing subpopulation of labeled NAs for the different physiological sources, where the method comprises producing subpopulation of labeled NAs for the different physiological sources, omprising the populations for each physiological sources, of it is preferred by hybridising the labeled NAs for each proposal source to identify differences in the population, where the comparison is preferably subjected by hybridising the labeled NAs for each of the distinct physiological sources to an array of probe NAs stably associated with the surface of a substrate to produce a hybridisation pattern for each of the surface of a substrate to produce a hybridisation pattern for each of the sources, where conferences, and comparing the patterns for each of the sources, under tissue or subfissue types. The present sequence is a tissue, or different tissue or subfissue types. The present sequence is a thus agene specific PCR primer used in the method of the invention. Note: The sequence data for this patent did not form part of the printed specific promined in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                              Producing sub-population of labeled nucleic acids, useful for analyzing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       relates to producing a sub-population of labeled nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

Sequence 24 BP; 5 A; 0 C; 6 G; 13 T; 0 U; 0 Other;

Exbp protein 12.87. The invention also comprises a method for producing the polypeptide by recombinant DNA technology. The polypeptide is useful in treating malignant tumours, haemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations. Also disclosed in the invention is an antagonist to the fkbp protein and a method for its use. The present sequence represents a reverse transcriptase (RT) PCR primer used to isolate the human fkbp 12.87 cDNA of the invention This invention relates to the DNA and protein sequences of a novel human New human fkbp protein 12.87 and encoding polynucleotide for treating malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations. Example 2; Page 17 (disclosure); 33pp; Chinese. WPI; 2002-714435/78. WPI; 2001-408485/43 Mao Y, Xie Y; 07-JAN-2003 Homo sapiens CN1352169-A. 05-JUN-2002 ABS54833; RESULT 5 엄 ò

```
New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                         EST; ss; probe; expressed sequence tag; microarray; gene (genetic variation; biallelic marker; polymorphism; human;

                                                                                                g
                                                                                                                                                                                                       ö
                                                                             The invention relates to a novel polypeptide comprising a fully defined 130 amino acid sequence given in the specification and its amides, esters and size. The polypeptide has anterior pituitary hormone-related activity. It is useful for the treatment of hypertension, autoimmune diseases and heart failure. The screening method and kit also provided in the invention are useful for identifying new substances for treating and preventing these diseases. The present sequence is a primer used to isolate the nucleotide sequence encoding the polypeptide of the invention
Polypeptides for treatment of hypertension, autoimmune disease and heart

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018 500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in pybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises the probes and detecting the hybridisation. The nucleic acid probes are atlached to a solid support. The analysis comprises moritoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific or probes is useful in in situ hybridisation, in Southern, Northern or dottores of any gene, in mapping the 5' termini of mRNA molecules by containing compared in the microarray. Note: The sequence of the isolated and previously sequenced. The sequence presented is one of the involetic acid probes incorporated in the microarray. Note: The sequence of the form this patent can also be obtained in electronic format directly from USPTO at sequence. The invention relates to the polypeptide DNA topoisomerase II (TOP2) 21.34, a polymuclectide encoding the polypeptide and a method for producing the polypeptide by DNA recombination technology. The polypeptide is used for curing several diseases, such as malignant tumours, haemopathy, development disturbance, human immunodeficiency trunk [HIV] infection, immunological diseases and various inflammations. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in isolation of CDNA encoding DNA topoisomerase II (TOP2) 21.34
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining a toxicological response to an agent, useful for screening of

drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of Claim 1; Page 337; 455pp; English toxicity

The present invention describes a method (MI) for determining a toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile of one or more human toxic response to a determining the presence of a toxic response to the agent. Also catermining the presence of a toxic response to the agent. Also comprising one or more polymolectides selected from the genes corresponding to the partial sequences given in ABZ82842 corresponding to the partial sequences given in ABZ82842 corresponse gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising: (a) exposing cells to an agent or isolating cells from a human subject who can exposed to an agent or isolating cells from a human subject who can putatively identified toxic response gene after exposure to a known toxic pharmaceutical or industrial agent, and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or profile in the arrays computing the human genes are useful for toxic predicting and determining the human genes are useful for toxic toxicological screening of drugs, pharmaceutical compounds and chemicals

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 81945; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for manlysis of at least one target sequence. The method of analysis comprises of the pridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or docton the hybridisation to identify or detect the sequence or specific acid contact additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence contains of ata for this patent can also be obtained in electronic format directly the form of the contains of acid in acid probes incorporated in the microarray. Note: The sequence to the sequence of the acid for this patent can also be obtained in one centure.

New polynucleotide homologous with a portion of one strand of the human FEZ1 gene, useful for alleviating abnormal cell proliferation such as

```
FEZI is a tumour suppressor gene, located at chromosome location 8p22.

Decreased or no expression of FEZI is detected in a variety of cancer cells. Expression of FEZI is detected in a variety of cancer cells. Expression of FEZI is detected in a variety of cancer cells. Expression of FEZI is detected in a variety of cancer cells. Expression and with protein FEZI cells. Expression and dephosphorylation modulates the effect of the FEZI protein. Inhibitors of FEZI gene expression are useful for inducing cells to proliferate. Compounds which modulate FEZI association with tubulin are useful for alleviating tubulin hyper- or hypo-polymerisation disorders, such as those associated with aberrant confideration and cell growth, modulation of cell shape, cell rigidity, cell motility, rate and stage of cellular DNA replication, intracellular distribution of organelles, metastatic potential of cell and cellular cansformation from a non-cancerous to cancerous phenotype. Compounds which modulate FEZI binding and phosphorylation are also useful for alleviating a disorder, such as tumorigenesis, tumour survival, growth
                                             represent donor and acceptor sites of the human FEZ1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Collagen; human; recombinant; post-translational enzyme; procollagen; prolyl 4-hydroxylase alpha subunit; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
```

This primer is used to mutate a plasmid pBS(SK-) by PCR by introducing a NotI site upstream of the initiation codon for human prolyl 4-hydroxylase alpha subunit. This is used in the construction of recombinant vectors

Example 10; Page 57; 90pp; English.

Recombinant production of (pro)collagen having correct folding - using vectors encoding collagen sub:unit and collagen post-translational enzyme

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In a novel method, differentially expressed cDNA clones are identified by comparing cDNA obtained from abnormal breast tissue (e.g. ductal cardinoma in situ (DCIS)) samples with those obtained from normal breast epithelial cells. Such clones are useful as marker genes for pre-invasive human breast tissue. In a prefd, version of the method, differential expression of the marker gene is confirmed by using PCR amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection, diagnosis and treatment of pre-invasive breast cancer - by identifying differentially expressed marker genes, also use of BRCAl gene in therapy of breast cancer.

Claim 1; SEQ ID NO 98038; 9pp; English.

(AEOM-) AEOMICA INC.

Shannon ME; Chen W, Rank DR, Hanzel DK, Gu Y, Ji Y, Penn SG, New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

Disclosure; SEQ ID NO 13275; 214pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense mach or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, and analysis of genetic variation or in hybridisation to a DNA library. In analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of a least one target sequence. The method of analysis comprises the probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a sollid support. The analysis comprises monitoring probes are attached to a sollid support. The analysis comprises or family members of a gene and a cross-species comparison. Each of the probes is useful in in situ hybridisation, in Southern, Northern or dottored to a sollid supping the 5' termin of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of ENA that have been conclet acid probes incorporated in the microarray. Note: The sequence of the nucleic acid for this patent can also be obtained in electronic format directly from USPTO at sequence. Huml

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant empineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be expressing to reasons to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific blomolecule

Determining a toxicological response to an agent, useful for screening of drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity.

Claim 1; Page 331; 455pp; English.

The present invention describes a method (M1) for determining a toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity, and so reference gene expression profile indicative of toxicity, and so described: (1) an array comprising one or more polymodeotides selected from the genes corresponding to the partial sequences given in AB282842 to make gene corresponding to the partial sequences given in AB282842 to AB284764, or their fragments of at least 20 mucleotides, or homologues or and (2) determining if a gene putatively identified to be a toxic response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising: (a) exposing cells to an agent, (b) obtaining the test gene expression profile for a putatively identified toxic response gene after exposure to a known comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar, organ or predicting and determining toxicological responses on a cellular, organ or system level. The arrays comprising the human genes are useful for toxic longual screening of drugs, pharmaceutical compounds and chemicals

A service of the serv

WPI; 2003-268322/26. The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 candor amount specifically proteins, as standards in assays used to determine the concentration and/or amount specifically proteins, as specific biomolecule capture probes for surface-enhanced laser describin ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence for this patent did not form part of the printed sequence for this patent did not form part of the printed sequence in the sequence contact of the printed sequence for the present sequence and patent sequence are the present sequence are the present directly from WIPO can fire the present sequence and the sequence of the printed sequence and the sequence of the printed sequence and the present sequence and patent sequence and sequence and patent sequence and sequence and sequence and New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1. This invention relates to a novel isolated LPS-responsive and Beige- like Anchor (Irba) polypeptide which may be used to inhibit tumour growth. The invention also comprises an interfering RNA sequence which may be used to suppress lrba function and inhibit tumour growth. The polypeptide and small interfering RNA (siRNA) molecules of the invention may have cytostatic activity and may be used in gene therapy. Also disclosed is a method for inhibiting tumour growth in a patient comprising administering to the patient an agent that suppresses Irba function in the patient. The agent may be a polynucleotide fragment of an Irba gene or its variant, or a polympeptide fragment of an Irba gene or its variant, or a polympetide fragment of an Irba gene. The method of the invention may be used to treat a patient who is suffering from a tumour or a cancer, such as breast, prostate, melanoma, cervical or colorectal cancer, chronic myelogenous leukemia, adenocarcinoma, lymphoblastic leukemia or lung carcinoma. The present sequence represents a PCR primer used to amplify a lrba gene sequence of the invention

This invention relates to a novel isolated LPS-responsive and Beige- like Anchor (Irba) polypeptide which may be used to inhibit tumour growth. The invention also comprises an interfering RNA sequence which may be used to

A new isolated LPS-responsive and Beige-like Anchor polypeptide useful for inhibiting growth of tumors in a patient.

suppress lrba function and inhibit tumour growth. The polypeptide and small interfering RNA (siRNA) molecules of the invention may have cytostatic activity and may be used in gene therapy. Also disclosed is a method for inhibiting tumour growth in a patient comprising administering to the patient agent that suppresses Irba function in the patient. The agent may be a polymucleotide fragment of an Irba gene or its variant, or a polypeptide fragment of an irba gene or ins variant, or that interferes with the expression of the Irba gene. The method of the invention may be used to treat a patient who is suffering from a tumour or a cancer, such as breast, prostate, melanoma, cervical or colorectal cancer, chronic myelogenous leukemia, adenocarcinoma. Iymphoblastic leukemia or lung carcinoma. He present sequence represents a PCR primer used to amplify a lrba gene sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acids to at least two or more nucleic acids to at least two or more probes are attached to a solid support. The analysis comprises probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         in situ hybridization, in

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 110864; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisses match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridisation at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid ACKLO883

Debus J;

New peptide nucleic acid conjugate, useful for treating chronic myeloid leukemia, targets the Philadelphia chromosome and includes transport peptides.

Example 2; Fig 4B; 30pp; German.

This invention describes a novel conjugate for specifically inhibiting expression of a bcr/abl fusion gene comprising a transport mediator for the cell membrane, a protein or peptide for importation into the cell nucleus, and a peptide nucleic acid (PNA) that hybridizes specifically to the bcr/abl fusion gene, inhibiting its expression. The transport mediator is a protein or peptide that can overcome the plasma membrane, especially the transmembrane peptide phatp (43-58) or peptides designated TPUBCO, TPUHLV-1/TAT and TPUHLM. The conjugate may include a spacer, especially between protein and PNA, and it has the structure transport mediator-disulfide-protein-spacer-PNA. Spacers are preferably polylysine, polyethylene glycol, derivatives of polymethactylic acid and polyvinyl pyrrolidone. The conjugate of the invention binds to the fusion region of the boryabl genes in the Philadelphia chromosome, forming a triple helix and thus inhibiting expression of the corresponding fusion protein (a tyrosine kinase). The products of the invention are cytostatic and are used thronic myeloid leukaemia. Treatment with the conjugate is non-invasive and combining the PNA with a transport mediator ensures efficient, rapid and directed transport of PNA to its target site

ò produces stable blockade of transcription of target genes. The conjugat can discriminate between the gene fusion and unfused bcr and abl genes and is effective at very low concentrations (below 100 pM), so side effects should not be significant. This sequence represents a primer capable of binding to a fragment of the human abl gene intron 1b (see Genbank U07563). Gaps (nucleus). The PNA is resistant to both protease and nuclease, so .. 1.9%; Score 16.2; DB 1; Length 22; 85.7%; Pred. Polynucleotides comprising minimally cross-hybridizing nucleotide sequences, useful as tags or tag complements for use in a wide variety cresearch, medical or industrial applications, e.g. in diagnostic assays or DNA sequencing

Example 2; Page 75; 120pp; English.

The invention relates to a composition, which comprises molecules for use as tags or tag complements. Each molecule comprises an oligonuclectide selected from a set of oligonuclectides based on numeric identifiers (numerals 1-3) corresponding to the pattern of nucleotide bases present in 1168 nucleotide sequences fully defined in the specification. These oligonucleotides were found to be non-cross Mybridising. The composition is useful as a tag or tag complement, in analysing a biological sample for the presence of a mutation or polymorphism at a locus in a nucleic acid, and in determining the presence of a target suspected of being contained in a mixture. Also for use in a wide variety of research, medical, or industrial applications, e.g. identification of disease.

The composition contained to polymucleotides, identification of specific polymucleotide in blots of mixtures of polymucleotides, therapeutic blocking of in blots of mixtures of polymucleotides, therapeutic blocking of in plots of mixtures of polymucleotides, therapeutic blocking of in plots of mixtures of polymucleotides, therapeutic blocking of inappropriately expressed genes or DNA sequencing. The polymucleotides in parallel processing of analytes. The use of the polymucleotides provides minimal cross-hybridisation or cross-talk during the sorting process.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method, oligonucleotides and arrays for parallel measurement of genetic variations. The method is based on the presence of interrupted (non-palindromic) restriction endonuclease restriction sites (IRBRS) which flank and encompass genetic variation loci and is used for determining the identity of one or more nucleotides at a defined position in a single-stranded nucleic acid. Examples of estriction endonucleases which recognise interrupted sites are Bsli, EcoNI, AhdI, BslI and XmnI. The method of the invention involves the use of an immobilised antisense primer which anneals to the target nucleic
                                                                                                                                                  .

acid 3' of the position of interest, and a sense primer which corresponds to a sequence 5' of the position of interest. In addition, each primer includes part of the endonuclease recognition sequence, such that includes part of the endonuclease recognition sequence, such that carterial the nucleotide of interest is located in the variable region of the IRERS. The double-stranded DNA thus generated is then credion of the IRERS. The double-stranded DNA thus generated is then credion of the IRERS. The double-stranded DNA thus generated is then credion of the IRERS. The double-stranded DNA thus generated is then credion of the relevant restriction endonuclease, and the cleavage colored with the relevant restriction endonuclease; and the cleavage colored the restriction endonuclease; and the cleavage colored the restriction endonuclease; and the cleavage colored the restriction endonuclease; and arrays may be used to dentify mutations associated with a wide range of disease, including bladder carcinoma, colorectal tumours, sickle-cell anaemia, thalassaemias, alpha-l-antitrypsin deficiency, lesch-NWhan syndrome, cystic fibrosis/funcoviscias, burdened-dependent mental deficiency, harmochromatosis, severe combined immunodeficiency, albiniam, alkaptomuria, lysosomal storage disease, blers-ballos syndrome, alkaptomuria, lysosomal storage diseases, blers-ballos syndrome, alkaptomuria, lysosomal storage diseases, blers-ballos syndrome, alkaptomuria, lysosomal storage diseases, blers-ballos syndrome, companient, and von Hipple-Lindau disease. The method, primers and arrays myorialish and sociated with drug resistance. The method offers a corporative, and von Hipple-Lindau disease. The method of parallel measurement of genetic variations. The method, primers and employ readily available detection techniques. In an exemplification of the invention, an allele of interest from the bacteriophage lands and proper convenient, which was analysed by electrospray-liquid chromatography/mass

from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus DNA polymerase, Escherichia coli Sacoli and the Saccharomyces cerviviae Radi/RadiO complex. The nucleic acid substrate is preferably an oligonucleotide containing a human p53 gene sequence or alternatively, microbial gene sequences. Cleavage products are compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter. The method may also be used for the identification of viruses, especially hackeris compatitis C virus and similan immunodeficiency virus. The human tyrosinase sequence for the method. Three primers (AAT29080-81) was used as a test sequence for the method. Three primers (AAT29080-81) was used as a test other primers (AAT27689-90) and in combination, to amplify fragments of

The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction of PDM, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
                                                                                                                                                                                                                                                                                                                                                                          ô
New oligonucleotide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises a gene panel constructed from the expression profile of known genes which show a change in expression level between normal liver cells and liver cells under regeneration. The gene panel is useful for providing expression data and screening/development of drugs for liver regeneration (e.g. when treating hepatitis, after transplantation or removal of the liver during cancer or hepatitis therapy). The present DNA sequence represents a PCR primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene panel participating in liver regeneration, applicable in providing expression data, diagnosis and development of drugs for promoting liver regeneration e.g. after transplantation or removal of liver during

This invention describes novel antisense oligonucleotides (OGNS) (1) 8-20 nucleotides in length that specifically hybridize with and inhibit nucleic acids encoding human Fas-associated death domain (FADD), targeted exptes 3' untranslated region (3'UTR). (1) can be used to treat animals, especially humans, suspected of having or being prone to a disease or condition associated with FADD expression. AAZ44746-Z44831 represent primers and probes used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotides, useful for inhibiting human Fas-associated death domain (FADD) expression are targeted to the 3' untranslated region
                                                                                                               FADD; human; antisense; inhibitor; Fas-associated death domain; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ornithine decarboxylase-like protein; ODC-p; human;

The gene, and fragments of it, can be used in the prevention, treatment, diagnosis and detection of a predisposition to LGMD2 disease. Fifty primers (AAT32510-59) were used to specifically amplify the exons and splice junctions of the calpain large subunit 1 gene as well as the regions containing the putative CAT, TATA boxes and the polyadenylation signal. Two primers (AAT32534, AAT32535) were used to amplify exon 12 of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human novel Calpain large sub:unit 1 gene encoding a calcium dependent protease - used to develop prods. for the diagnosis and treatment of limb-girdle muscular dystrophy 2 disease.

The primer (+ve polarity) corresponds to bases 678-700 from the cryptic plasmid of C. trachomatis L1 serovar, (Hatt et al., Nucleic Acids Research, 16:4053-4067,1998). It was used in conjunction with primer CP-38 (-ve polarity, AAQ11185), together designated Primer Set B, to generate a 173 bp amplicon by PCR. The DNA was then detected by a capture probe, CP-39 (-ve polarity; AAQ11186), using a plate assay. See also

After the target DNA has been amplified it is labelled with biotin. The labelled DNA is specifically captured by base-pair hybridization to an amplicon-specific oligonucleotide probe which is bound to a solid support and the labelled DNA is detected with a biotin dependent chromographic detection assay.                                                                                                                                                                                                                                                                                 a
                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                           The present sequence is a 5' primer for the human ornithine decarboxylase -1ike protein (ODC-p) gene. The primer is based on ODC-p cDNA (see ACC4876) beginning 10 nucleatides upstream from the predicted start codon. PCR was performed using this primer to identify alternatively splice variants of ODC-p (see ACC48727-33), using brain and testis tissue libraries as template. ODC-p and its splice variants are involved in cell differentiation, and different isoforms are expressed in different stages of neuronal or spermatozoal differentiation. Assays for the detection of CDC-p and its splice variants, particularly relative to ODC, are useful in the detection and monitoring of a central nervous system disease such as dementia, in the diagnosis of individuals with testicular dysfunction or fertility problems, and for screening of early testicular cancer.

CNOTE: The present sequence is identified as Seq ID 1 in Example 1 and in the sequence listing (see ACC48745)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

The present sequence is a 5' primer for the human ornithine decarboxylase—like protein (ODC-p) gene. The primer is based on ODC-p CDNA (see ACC48026) beginning 10 nucleotides upstream from the predicted start codon. PCR was performed using this primer to identify alternatively splice variants of ODC-p (see ACC48727-13), using brain and testis tissue libraries as template. ODC-p and its splice variants are involved in cell differentiation, and different isoforms are expressed in different stages of neuronal or spermatozoal differentiation. Assays for the detection of ODC-p and its splice variants, particularly relative to ODC, are useful in the detection and monitoring of a central nervous system disease such as dementia, in the diagnosis of individuals with testicular dysfunction or fertility problems, and for screening of early testicular cancer
                                                                                                                                                                                                                                                                                  New nucleic acid molecule encoding an ornithine decarboxylase-like protein, useful for diagnosing and monitoring the treatment of Central Nervous System disease or testicular dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, PRO; EST; expressed sequence tag; PCR primer; hybridisation; probe; blood coagulation disorder; cancer; cellular adhesion disorder; secreted protein; transmembrane protein; ss.

After the target DNA has been amplified it is labelled with biotin. The labelled DNA is specifically captured by base-pair hybridization to an amplicon-specific oligonucleotide probe which is bound to a solid support and the labelled DNA is detected with a biotin dependent chromographic detection assay. (Updated on 25-MAR-2003 to correct PF field.)

The present invention describes secreted and transmembrane polypeptides and their polymucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AM23391 to AAZ34338, and AAY41685 to AAX41774 represent polymucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                         New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a novel polypeptide-human motor protein analogous protein 10.12, the polynucleotide encoding this polypeptide and a method for producing this polypeptide by using recombinant DNA technology. The invention also discloses the method for curing several diseases, such as protein metabolism discurbance related disease, membrane protein dysfunction related disease and cell withering
                                                                                                                                            Polypeptide-human myoglobulin IXA14.08 and polynucleotide for coding it.
                                                                                                                                                                                                                             The invention described a novel polypeptide-human myoglobulin IXA 14.08,
                                                                                                                                                                                                                                               the polymucleotide for coding it, the process for preparing the polymptide by DNA recombination, the application of the polymptide in treating diseases such as obesity and tumours, the antagonist of the polymptide and its medical action, and the application of the polymptide and its medical action, and the application of the polymorleotide are disclosed. This sequence represents a reverse transcriptase (RT)-PCR primer used to isolate cDNA encoding the human myoglobulin IXA 14.08 described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A novel polypeptide-human motor protein analogous protein 10.12 and polynucleotide for coding this polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78670 to AAC78897 represent PCP primers and probes used in the isolation of the

dysfunction related disease by using this polypeptide. Also disclosed is an antagonist for resisting this polypeptide and its therapeutic action, and the application of the polymucleotide encoding this novel human motor protein analogous protein 10.12. The present sequence is a reverse transcriptase (RT)-PCP primer used to isolate the cDNA encoding human motor protein analogous protein 10.12

Polynucleotides comprising minimally cross-hybridizing nucleotide sequences, useful as tags or tag complements for use in a wide variety cresearch, medical or industrial applications, e.g. in diagnostic assays or DNA sequencing.

οţ

Example 2; Page 64; 120pp; English.

The invention relates to a composition, which comprises molecules for use as tags or tag complements. Each molecule comprises an oligonucleotide selected from a set of oligonucleotides based on numeric identifiers (numerals 1-3) corresponding to the pattern of nucleotide bases present in 1168 nucleotide sequences fully defined in the specification. These oligonucleotides were found to be non-cross hybridising. The composition is useful as a tag or tag complement, in analysing a biological sample for the presence of a mutation or polymorphism at a locus in a nucleic acid, and in determining the presence of a target suspected of being contained in a mixture. Also for use in a wide variety of research, medical, or industrial applications, e.g. identification of disease-related polynucleotides in diagnostic assays, screening for clones of cover target polymucleotides, identification of specific polynucleotide in blots of mixtures of polynucleotides, therapeutic blocking of inappropriately expressed genes or DNA sequencing. The polynucleotides processing of analytes. The use of the polynucleotides provides minimal cross-hybridisation or cross-talk during the sorting process. Thus, any sequence within the family of sequences will not significantly.

Example 48; Page 151; 453pp; English.

The invention describes an isolated nucleic acid (I) comprising, or which is at least 80 % sequence identity to, or the full-length coding sequence of, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ

100 mg

  ö
 failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, ALDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated primer.

     The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful in the pro polypeptide is useful for inking a bioactive molecule to a cell. The PRO polypeptide is useful for inking a bioactive molecule to a cell. The PRO polypeptide is useful for modulating a biological activity of a cell. The PRO polypeptide is useful for modulating a biological activity of a cell. The PRO polypeptide is useful in industrial applications including to plarmaceuticals, diagnostics, biosensors and bioreactors. The PRO collypeptide is a thrombolytic agent, interferon, collypeptide is a thrombolytic agent, interferon, interferon, interferon, expressive the PRO polypeptide is useful for treating disease such as amyotrophic lateral carcinoma, apoptosis related conditions e.g. AIDS, amyotrophic lateral carcinoma, apoptosis related conditions e.g. AIDS, anyotrophic lateral carcinovascular disease e.g. Aptheimer's disease, activities and inflammatory disease e.g. pulmonary hypertension and gomerulonephritis; lung disease e.g. pulmonary hypertension, bronchial asthmasy gastrointestinal disorders e.g. permature labour and preclampsia, carcinogenesis. The present sequence represents a PRO polypeptide associated oligonucleotide of the invention. Note: The special for this patent did not form part of the printed case sequence the sequence the precent than Proclampsia is related in electronic format directly from USPTO cat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
 New isolated PRO polypeptides e.g. PRO213, PRO274 and PRO300, for use as pharmaceuticals, diagnostics, biosensors and bioreactors, for identifying modulators of receptor-ligand interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0-MAR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   12-NOV-
  The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for inking the proteins of calls expressing PRO polypeptides, for modulating biological activities of calls expressing PRO polypeptides, and for for identifying agonists or antagonists. The bioactive molecule maybe a coxin, radiolabel or antibody, and causes apoptosis or death of the cell. The PRO polypeptides are useful for treating immune disorders, diabetes or hyper- or hypo-inaulinaemia, cardiac insufficiency, nervous system disorders, kidney disorders, bone and cartilage disorders or arthritis, tumours, and wound healing. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, for the genetic analysis of individuals with genetic disorders, and in gene therapy. The present sequence represents a PCR primer used in the examples of the present invention. Note: The sequence data for this the present sequence represents a PCR primer used in the was obtained in electronic format directly from the USPTO web site

(GETH) GENENTECH INC.

Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL; Ferrara N, Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME; Goddard A, Godowski PJ, Grimaldi UC, Gurney AL, Hillan KJ; Kljavin IJ, Kuo SS, Napier MA, Pan J, Paoni NF, Roy MA, Shelton DL; Stewart TA, Tumas D, Williams PM, Wood WI;

WPI; 2003-341189/32

New genes and secreted and transmembrane polypeptides (e.g. PRO337 or PRO1559), useful for treating or diagnosing e.g. cancers, atherosclerosis, infertility, stroke, encephalitis, hepatitis or multiple sclerosis in mammals.

Example 48; Page 153; 460pp; English.

The invention relates to a new isolated nucleic acid molecule comprises a sequence with at least 80% identity to: (a) a nucleotide encoding any of 94 PRO polypeptides whose sequences are fully defined in the specification; or (b) any of 94 nucleotide sequences fully defined in the specification; or the full length coding sequence of any these 94 nucleotide sequences. Also included are an isolated PRO polypeptide sequences: Also included are an isolated PRO polypeptide sequences cited above (or an isolated PRO polypeptide having at least 80% amino acid sequence identity to: (a) an amino acid sequence conception; (b) the PRO polypeptide, lacking its associated signal peptide; or (c) an extracellular domain of the PRO polypeptide, with or specification; (b) the PRO polypeptide, lacking its associated signal peptide; a vascoiated signal peptide; a vascoiated signal peptide; a vascoiated signal peptide; a vascoiated signal peptide; a value of the PRO polypeptide fused concern comprising the vector (and producing a PRO polypeptides), a chimaeric molecule comprising the PRO polypeptide fused concern acid manner. PRO polypeptides or polymerlectides are useful as pharmaceuticals, disease, atherosclerosis, infertility, premature aging, psoriasis, concerned concerns are useful as pharmaceuticals, and in the disease, arthritis; immune-mediated alopecia, stroke, encephalitis, hepatitis, or multiple sclerosis in mammals. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases, and in the diagnostic determination. The PRO genes are useful as hybridisation probes, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for

New isolated PRO polypeptides for example extracellular, secreted and membrane bound proteins, useful for modulating the biological activities of cells and for treating, for example diabetes, cancer, rheumatoid arthritis, and hearing loss.

Example 48; Page 158; 461pp; English.

The invention describes an isolated secreted and transmembrane (PRO) polypeptide (1). PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and vice versa. PRO725. PRO700 and PRO700 and PRO700 and PRO700 and PRO700 is useful for detecting PRO725. PRO700 and PRO737 in a sample. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide, and PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO4933 polypeptide. PRO735, PRO700 and PRO735, PRO700 and PRO735, PRO700 and PRO735, PRO700 and PRO739 polypeptide, and PRO735, PRO700 and PRO739 polypeptides are useful for

The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO493, PRO337, PRO155, PRO75, PRO700 or PRO739 polypeptide, and for linking a bioactive molecule to a cell expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral meuropathy, diabetic peripheral neuropathy, AIDS-associated neuropathy, Charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Fabry's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL;

                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for inhting biological activities of cells expressing PRO polypeptides, for modulating identifying agonists or antagonists. The biologicus molecule maybe a toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcot-Marie-Tooth disorder, Refsum's disease, and Krabbe's disease. The polymucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for

(GETH) GENENTECH INC.

Desnoyers L, Baton DL; W, Gerber H, Gerritsen ME; Gurney AL, Hillan KJ; Botstein D, D Fong S, Gao W Grimaldi JC, AJ, Baker KP, Filvaroff E, Godowski PJ, Ashkenazi AJ, Ferrara N, Goddard A,

The invention describes an isolated secereted and transmembrane PRO polypeptide (I). PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various industrial applications. PRO polypeptide such as PRO300, PRO366, PRO703, PRO703, PRO703, PRO361, PRO352, PRO351, PRO352, PRO361, PRO615, PRO861, PRO616, Is useful for the areament of wound healing, tissue growth and the uscleding in the defects of viral infection. PRO200 is useful for the treatment of wound healing, tissue growth and amystrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or diabetic peripheral neuropathy. A polynucleotide (II) encoding (I) is amystrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or useful for generating transgenic animals or knockout animals which are cuseful in the development and screaning of therapeutically useful cuseful in the development and screaning of therapeutically useful confined sequences, and to construct hybridisation probes for individuals with generic disorders, for recombinantly expressing (I) and confined the effect of the PRO polypeptide (C contragonists) or prevent the effect of the PRO polypeptide (antagonists). (I) and (II) are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample confinity purification of PRO from recombinant cell culture or natural control or profess. This sequence represents a human secereted and transmembrane PRO propers or served and transmembrane PRO propers and propers and purposes. Novel secreted and transmembrane polypeptides and polynucleotides encoding them, useful for treating wound healing, tissue growth and muscle generation and regeneration, amyotrophic lateral sclerosis or n J, Paoni NF, Wood WI; Example 48; SEQ ID NO 305; 472pp; English. The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to a maino acid sequence closen from 4 fully defined sequence identity to a maino acid sequence chosen from 4 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide. Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO uncleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO flued to a heterologous amino acid sequence, and an anti-PRO polypeptide in a sample suspected of containing PRO493 polypeptide. PRO493 polypeptide is useful for detecting PRO493 polypeptide is useful for detecting PRO493 polypeptide is useful for detecting PRO455 PRO700 or PRO739 polypeptide is useful for linking a profess pelvin and producine process per process process death of the cell. PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bloactive molecule cell. PRO337 polypeptide is useful for linking a molecule is the cell. PRO337 polypeptide is useful for linking a molecule is the cell. PRO337 polypeptide is useful for linking a molecule is the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, ss; PCR; secreted protein, transmembrane protein, PRO, cytostatic, ophthalmological, antiarthritic, osteopathic; antirheumatic; vulnerary; auditory; tumour growth, retinal disorder; sports-related joint problem, articular cartilage defects; osteoarthritis; rheumatoid arthritis; wound healing; hearing loss; primer.
                                                                                                                                                                       New isolated secreted and transmembrane PRO polypeptides, useful in the preparation of a medicament for treating a condition responsive to the polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1.9%; Score 15.8; DB 1; Length 24; 89.5%; Pred.                                                              The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity on amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide. Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acids encoding the PRO proteins comprising the vector and producing PRO, a chimaeric molecule comprising PRO included to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for derecting a PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337 polypeptide is useful for detecting PRO337 polypeptide is useful for detecting pRO4993 polypeptide. PRO325, PRO700 or PRO739 polypeptide is useful for detecting PRO337 PRO1859 PRO1859 polypeptide is useful for detecting
                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, ss, PCR, secreted protein, transmembrane protein, PRO, cytostatic, ophthalmological, antiarthritic, osteopathic, antirheumatic, vulnerary, auditory, tumour growth, retinal disorder; sports-related joint problem, articular cartilage defects, osteoarthritis, rheumatoid arthritis, wound healing; hearing loss; primer.
                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                        Novel secreted and transmembrane polypeptides, designated PRO polypeptides, and polynucleotides encoding them useful for treating kidney diseases, bone, cartilage and retinal disorders.
                                                                                                                                                                                                                                                                                                                                          .

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity on amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide. Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 similarly, PRO4993 polypeptide is useful for detecting PRO337
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      vulnerary; virucide; neuroprotective; cytostatic; gene therapy; tumour cell proliferation inhibitor; secereted and transmembrane protein; PRO; viral infection; wound healing; tissue growth; muscle generation; muscle regeneration; amyotrophic lateral sclerosis; neuropathy; AlDS-associated neuropathy; diabetic peripheral neuropathy; chromosome identification; antagonist; tissue typing; immunohistochemical staining; primer; ss.

```
Novel isolated secreted and transmembrane PRO polypeptides, useful in t
preparation of a medicament for treating a condition responsive to the
polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL;

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity con an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal comprising included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting a polypeptide. PRO725, PRO700 or PRO739, PRO4093 polypeptide is useful for linking a coll-cule for the toxin, radiolabel, or an antibody. The bioactive molecule to a cell expressing PRO337 polypeptide; BRO525, PRO700 or PRO739, PRO4933 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4933 polypeptide; RRO725, PRO700 or PRO739 polypeptide, and PRO1559 polypeptide is useful for linking a cuseful for linking a bioactive molecule to a cell expressing PRO4933 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4933 polypeptide or anti-PRO337 polypeptide is useful for modulating the cell expressing PRO4933 polypeptide is useful for modulating is useful for modulating is useful for modulating the cell expressing PRO4933 polypeptide or anti-PRO39 polypeptide or anti-PRO39 polypeptide or modulating the biological activity of the cell expressing PRO4933 polypeptide or modulating the biological activity of the cell expressing PRO4933 polypeptide.

polypeptide; and PRO1559 polypeptide or anti-PRO725, anti-PRO700 or anti-
PRO739 polypeptide is useful for modulating the biological activity of
the cell expressing PRO725, PRO700 or PRO739 polypeptide. The
polypeptides are useful for inhibiting tumour growth, retinal disorders,
sports-related joint problems, articular cartilage defects,
osteoarthritis or rheumatoid arthritis, wound healing and hearing loss in
mammals. The present sequence is a PCR primer used to isolate nucleic

peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO profused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in a sample suspected of containing PRO4993 polypeptide.

CC polypeptide. PRO735, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for linking a biactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule content of the cell apprehensing PRO4939 polypeptide is useful for linking a bioactive molecule or a cell expressing PRO4939 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO359, polypeptide or anti-PRO339 polypeptide is useful for modulating the biological activity of the cell expressing PRO3493 polypeptide is useful for modulating the biological activity of the cell expressing PRO3493 polypeptide is useful for modulating the biological activity of the cell expressing PRO3493 polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO3493 polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO359 polypeptide or an anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO359 polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO359 polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO359 polypeptide or anti-PRO493 polypeptide is useful for inhibiting the biological activity of the cell expressing PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 60% amino acid sequence identity con ammembrane protein) having at least 60% amino acid sequence identity con a maino acid sequence chosen from 94 fully defined sequence is given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO. a chimaeric molecule comprising the vector and producing PRO. a chimaeric molecule comprising to a heterologous amino acid sequence, and anti-PRO anti-PRO. peptide is useful for detecting PRO. 50 polypeptide in a sample suspected of containing PRO4993 polypeptide is useful for detecting PRO4999 polypeptide is useful for detecting PRO4999 polypeptide is useful for detecting PRO4999 polypeptide is useful for linking a bloactive molecule to a cell PRO4999 polypeptide is useful for linking a bloactive molecule is the toxin, radiolabal, or an antibody. The bloactive molecule call. PRO4999 polypeptide is useful for linking a bloactive molecule is the toxin, radiolabal, or an antibody. The bloactive molecule is useful for linking a bloactive molecule is useful for linking a bloactive molecule is useful for linking a bloactive molecule is useful for molecule or anti-PRO4999 polypeptide or an anti-PRO4999 polypeptide is useful for molecule or anti-PRO4

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given to an amino acid sequence chosen from 94 fully defined sequences as given to an amino acid sequence chosen from 94 fully defined sequences as given be peptide, a PRO extracellular domain with or without its associated signal peptide. Also included are nucleic acids encoding the PRO proteins comprising the vector and producing PRO, a chimaeric coll comprising the vector and producing PRO, a chimaeric molecule comprising produced to a heterologous amino acid sequence, and an anti-PRO antibody. PRO493 polypeptide is useful for detecting a PRO493 polypeptide is useful for detecting a PRO493 polypeptide. PRO705. PRO700 or PRO739. PRO4939 polypeptide is useful for detecting PRO317. PRO4939 polypeptide is useful for detecting PRO325. PRO700 or PRO739. PRO4939 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4933 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4933 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4933 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4933 polypeptide or anti-PRO35, compositive in the cell expressing PRO4933 polypeptide or anti-PRO337 polypeptide or anti-PRO333 polypeptide or anti-PRO337 polypeptide or anti-PRO337 polypeptide or anti-PRO337 polypeptide or anti-PRO339 polypeptide or anti-PRO339 polypeptide or anti-PRO339 polypeptide or anti-PRO359 polypeptide or an New secreted and transmembrane PRO nucleic acids and polypeptides, useful for stimulating the release of tumor necrosis factor alpha from human blood and stimulating the proliferation of differentiation of chondrocyte sports-related joint problems, articular cartilage defects, osteoarthritis or rheumatoid arthritis, wound healing and hearing loss in mammals. The present sequence is a PCR primer used to isolate nucleic the cell expressing PR0725, PR0700 or PR0739 polypeptide. The polypeptides are useful for inhibiting tumour growth, retinal disorders, Example 48; SEQ ID NO 305; 462pp; English. acid encoding a PRO protein.

New genes, and its encoded secreted and transmembrane polypeptides, useful for treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia,

hypoinsulinemia or wounds

Example 48; SEQ ID NO 305; 459pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity con an amino acid sequence in the specification (including PRO lacking its associated signal in the specification (including PRO lacking its associated signal peptide). Also included removes the without its associated signal peptide). Also included removes a cide encoding the PRO proteins mentioned above, a vector comprising as PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimacin molecule comprising the vector and producing PRO, a chimacin molecule comprising the vector and producing PRO, a chimacin molecule comprising the vector and producing PRO, a chimacin molecule comprising the vector and producing PRO, a chimacin molecule comprising the vector and producing is useful for detecting a PRO4993 polypeptide is useful for detecting a projection propagatide. PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for detecting projectide. PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a ploative molecule to a cell expressing PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4993 polypeptide; PRO725, PRO700 or PRO739 polypeptide, and PRO1559 polypeptide; producing p

osteoarthritis or rheumatoid arthritis, wound healing and hearing loss in mammals. The present sequence is a PCR primer used to isolate nucleic acid encoding a PRO protein.

```

```
The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity can amino acid sequence chosen from $4$ fully defined sequence identity con an amino acid sequence chosen from $4$ fully defined sequence identity con an amino acid sequence chosen from the specification (included are nucleic acids encoding the PRO proteins peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising the vector man producing PRO, a chimaeric molecule comprising propertied is useful for detecting a PRO4993 polypeptide is useful for detecting propertied. PRO725, PRO700 or PRO725, PRO7
                                                                  Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL; Ferrara N, Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME; Goddard A, Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ; Kljavin IJ, Kuo SS, Napier M, Paoni NF, Roy MA, Shelton DL; Stewart TA, Tumas D, Williams PM, Wood WI;
                                                                                                                                                                                                                                                                       New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO4993 or PRO337, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                       Example 48; SEQ ID NO 305; 460pp; English

Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning. A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel mapping complex genomes, designated "sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the AAGB2001-082706 for STS primers. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Stem cell antigen 2; thymocyte; neuronal cell; organ transplantation; Alzheimer's disease; paroxysmal nocturnal haemaglobinureia; inflammation; glycosyl phosphatidylinositol anchor; GPI; neoplasia; signal peptide; metastasis; agonist; antibody; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequencing complex genomes, present as fragments in a cosmid library - k sequencing end-specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
The invention relates to an isolated polynucleotide comprising a polynucleotide with at least 95% identity to a polynucleotide encoding a human stem cell antigen 2 (Msca-2) polypeptide comprising amino acids 1-82 of the mature hsca-2 or a polynucleotide encoding the same mature polypeptide encoded by the human cDNA in ATCC Deposit No.97301, or their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gocayne JD;

                                                                                                                                                                                                                                         PCR primers T8932-3 were used to amplify human stem cell antigen 2 (hScanapper, minus the signal peptide sequence. These primers were used to amplify hSca-2 gene for insertion into a bacterial expression vector pQe-60 (giagen). The hSca-2 gene and protein are used to treat disorders where a patient needs hSca-2, e.g. for stimulating maturation and differentiation of thymocytes, to protect neuronal cells, to prevent rejection during organ transplantation, to treat parcysmal nocturnal haemoglobinuria and to treat Alzheimer's disease. hSca-2 antagonists, e.g. antibodies may be used in the treatment of neoplasia by preventing metastasis. It can also be used to diagnose a disease or susceptibility to a disease related to under-expression of the polypeptide by determining the presence of a mutation in a hSca-2 sequence

The present invention is related to the isolation of the human stem cell antigen 2 (NSca-2) protein and coding sequence. This protein is a member of the Ly-6 superfamily and is involved in the cell activation of haematopoietic cells. The protein and its coding sequence can be used in the diagnosis and treatment of inflammatory and infectious disorders of the nervous system, hyper-acute rejection, paroxysmal nocturnal haemoglobinuria (PNH), haemolytic anaemia, pancytopaemia, venous thrombosis and Alzheimer's disease, possibly via gene therapy. In addition, they can be used to promote thymocyte maturation and

complements. Also included are hSca-2 vectors, host cells, anti-hSca-2 catibodies, antagonists and identifying compounds which bind to/inhibit Sca-2. bisca-2 is useful for treatment of a patient with need of a hSca-2 protection and the antagonist is useful for the treatment of a patient with need to inhibit hSca-2 polypeptide in vivo. Human Sca-2 polypeptide is useful for standants in processes. hSca-2 polypeptide is useful for standants thymocyte maturation and differentiation, protecting neuronal cells, preventing rejection during organ transplantation, treating cells, preventing rejection during organ transplantation, treating inflammatory and inflammatory and inflammatory and inflammatory and infectious disorders of the neurous system, prevents complement-mediated lysis and activation of endothelial cells for the treatment of hyperacute rejection and may be employed during resonate compan transplantation. The polypeptide are also employed as anti-inflammatory, anti-coagulant and as anti-tumoural agents, and are also involved in antigen presentation to obtain an immune response. The polypeptides are also involved in antigen presentation to obtain an immune response. The polypeptides are also useful for chromosome identification. hSca-2 polypeptides are also useful to isolate the polypeptide from tissue expressing the polypeptide. The present sequence is a PCR primer which amplifies a coli nucleic acid encoding mature hSca-2 for expression in B. coli

New substantially homogenous cell population that co-express CD49c, CD90

```
The sequences given in AB080288-99 are primers which were used to
determine the expression of transcripts encoding regulators of cell
c growth and osteoblast differentiation. These primers were used to test
the cell populations of the invention which co-express CD49c, CD90 and
telomerase. The expression of transcripts for telomerase, p21, p53, CBRA1
cand BSP were determined using quantitative PCR. Cell populations which co-
express CD49c and CD90 express telomerase at the level of approximately
c express CD49c and CD90 express telomerase at the level of approximately
c 13 transcripts/10 power 6 transcripts of 18S rRNA, and these populations
c continue to proliferate at a constant rate. Compositions containing the
cell populations of the invention are useful in treating humans suffering
from a degenerative, traumatic, acute injury, cardiac or neurological
condition, e.g., such as spinal cord injury, amourcrophic lateral
sclerosis, Parkinson's disease, stroke, traumatic brain injury, Fabry
Disease condition, metachromatic dystrophy, adrenal leukodystrophy,
c Canavan disease, Pellaraeus Merzbacher, Nieman-pick or brain tumour,
myocardial infarction or congestive heart failure. This primer is
c deposited under Genbank ID AF015950 and its by location is 1625-1650 bp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention describes secreted and transmembrane polypeptides and their polymotlectides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAX33891 to AAX34338, and AAX41685 to AAX41774 represent polymucleoride and polypeptide sequence given in the exemplification of the present invention New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders. The invention relates to an oligonucleotide array (1) comprising at least different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (1) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (1). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid, which further

                                                                                                                                                                                                                                                                             AAC78458 to AAC78599 represent polynucleotide and BST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78897 represent PCR primers and probes used in the isolation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.

The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid, which further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid,
                                                                                                                                                                                                                                                                                                                                                            Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; secreted and transmembrane protein; PRO; virucide; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
The invention describes an isolated nucleic acid (I) comprising, or which is at least 80 % sequence identity to, or the full-length coding sequence of, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antiseanse RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful it issue typing. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL;

New isolated PRO polypeptides e.g. PRO213, PRO274 and PRO300, pharmaceuticals, diagnostics, biosensors and bioreactors, for modulators of receptor-ligand interactions. for use as identifying

SEQ ID NO 246; 55pp; English.

The invention relates to an isolated secreted and transmembrane CC polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful CC in PRO polypeptide detection methods. The PRO polypeptide is useful for CC linking a bioactive molecule to a cell. The PRO polypeptide or an antibody against it is useful for modulating a bioactive molecule to a cell. The PRO polypeptide or an CC cell. The PRO polypeptide is useful in industrial applications including pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is useful in industrial applications including pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is useful for treating disease such as corrected interleukin, erythropoletin, colony stimulating factor and other CC polypeptide is useful for treating disease such as CC cancer e.g. colorectal carcinoma; apoptosis related conditions e.g. AIDS, CC amystrophic lateral sclerosis; inflammatory disease e.g. asthma, CC atheroselevosis; neurodegenerative disease e.g. Alzheimer's disease, CC markinson's disease; cardiovascular disease e.g. phypertension and CC myocardial ischaemia; kidney disease e.g. renal failure and componentits; lung disease e.g. pulmonary hypertension, bronchial asthma; gastrointestinal disorders e.g. gastric ulcer and inflammatory constituents are cardiovascular disease. The presents sequence represents a PRO properties associated oligonucleotide of the invention. Note: The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides are useful for detecting other PRO polypeptides, for linking biological activities of cells expressing PRO polypeptides, for modulating CC biological activities of cells expressing PRO polypeptides, and for for centrifying agonists or antagonists. The bioactive molecule maybe a convertion, radiolabel or antibody, and causes appitudes or death of the cell. The PRO polypeptides are useful for treating immune disorders, diabetes or hyper- or hypo-insullnaemia, cardiac insufficiency, nervous system CC disorders, kidney disorders, bone and cartilage disorders or arthritis, cc tumours, and wound healing. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene capping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout canimals, for the generatic analysis of individuals with genetic disorders, and in gene therapy. The present sequence represents a PCR primer used in the examples of the present invention. Note: The sequence data for this can sequence and septent was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                The invention relates to a new isolated nucleic acid molecule comprises a sequence with at least 80% identity to: (a) a nucleotide encoding any of 94 PRO polypeptides whose sequences are fully defined in the compectation; or (b) any of 94 nucleotide sequences fully defined in the compectation; or the full length coding sequence of any these 94 cmucleotide sequences. Also included are an isolated PRO polypeptide nucleotide sequence included are an isolated PRO polypeptide having complypeptide sequences cited above (or an isolated PRO polypeptide having the specification; (b) the PRO polypeptide, or (c) an extracellular domain of the PRO polypeptide, or (c) an extracellular domain of the PRO polypeptide, with or cacid molecule, a chimaeric molecule comprising the PRO polypeptide, with or acid molecule, a chimaeric molecule comprising the PRO polypeptide, with or cacid molecule, a chimaeric molecule comprising the PRO polypeptide fused to a heterologous amino acid sequence and an anti-PRO antibody. The PRO polypeptides or polymeptides or polymeptides or polymeptides or polymeptides fused to a heteroscian state of the sequence and an anti-PRO antibody. The PRO colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, renal disease, arthritis, immune-mediated alopecia, stroke, encephalitis, hepatitis, or multiple sclerosis in mammals. The PRO polypeptides are useful in drug screening, particularly as targets of the presence of these diseases, and in the diagnostic determination of the presence of these diseases, and in the diagnostic contentification. The PRO genes are useful as hybridisation probes, or for convex are propolymeptides are useful as hybridisation probes, or for convex are useful as phormacounties are convex encoding a pro polymeptide.

                                                                                                                                                                                                                                                                                                                                                                  CC ACC69640 to ACC69648 encode the cadherin-like asymmetry proteins (CLASPs)
CC given in ABR43625 to ABR43633. CLASP sequences have immunosuppressive,
CC antiinflammatory, antirheumatic, antiarthritic, dermatological and
CC nephrotropic activities. Compositions comprising a CLASP-1 protein can be
CC used for treating or preventing a CLASP-1 mediated disease, particularly
CC an autoimmune disease caused or exacerbated by increased activity of TH1
CC (helper T) cells. CLASP polynucleotides can be used as probes or primers
CC for detecting CLASP polynucleotides can be used as probes or primers
CC for detecting CLASP expression, for screening CLASP agonists or
CC (antagonists, for creating transgenic animals, chromosome mapping,
CC identifying animals from minute biological samples, polymorphic markers
CC for forensic analysis, and as reagents for paternity testing. CLASP
CC polynucleotides or polypeptides are useful in treating or preventing
CC autoimmune diseases (e.g. Addison's disease, rheumatoid arthritis, or
CC (e.g. sepsis, arthritis or nephritis), or infectious disease, inflammation
CC (e.g. sepsis, arthritis or nephritis), or infectious diseases. ACC69649
CC exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO337 polypeptide is useful for detecting PRO4933 polypeptide in a sample, and vice versa, PRO725, PRO700 and PRO739 are useful for detecting PRO1559 polypeptide in a sample, and PRO1559 is useful for detecting PRO1559 pro700 and PRO739 in a sample. PRO4933 is useful for inking a bioactive molecule to a cell expressing a PRO337 polypeptide, and PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide. PRO4933 polypeptide. PRO4933 polypeptides are useful for linking a bioactive molecule to a cell expressing a PRO735 pro700 and PRO739 polypeptide, and PRO335, PRO700 and PRO739 polypeptides are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           membrane of cells
